

I support satellite radio broadcast of traffic and weather information. It is certainly a safety enhancement when driving in congested areas. The satellite system frees the driver from trying to locate a commercially generated traffic report from other sources, thereby eliminating the distraction of retuning the radio (channel surfing). In unfamiliar areas it is almost impossible to locate the correct radio station and get a timely traffic report because both the station frequency and traffic report schedules are unknown. Additionally, the satellite reports are continuous in nature, so information is always available. No commercial radio station offers that quality of service.
